Consider learning an image:

 Some patterns are much smaller than the whole image

Can represent a small region with fewer parameters

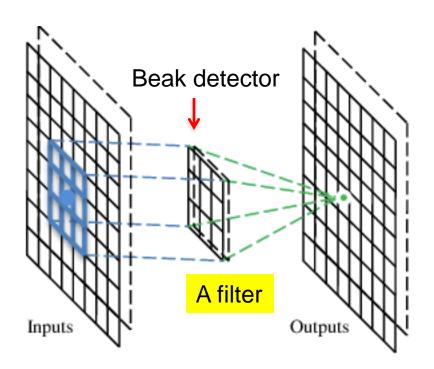

Same pattern appears in different places: They can be compressed!

What about training a lot of such "small" detectors and each detector must "move around".

A convolutional layer

A CNN is a neural network with some convolutional layers (and some other layers). A convolutional layer has a number of filters that does convolutional operation.

1	0	0	0	0	1
0	~	0	0	1	0
0	0	1	1	0	0
1	0	0	0	1	0
0	1	0	0	1	0
0	0	1	0	1	0

6 x 6 image

These are the network parameters to be learned.

1	-1	-1
Υ_	~	Υ-
-1	-1	1

Filter 1

-1	1	-1
-1	1	-1
-1	1	-1

Filter 2

: :

Each filter detects a small pattern (3 x 3).

1	-1	-1		
-1	1	-1		
-1	-1	1		

Filter 1

stride=1

1	0	0	0	0	1
0	1	0	0	1	0
0	0	1	1	0	0
1	0	0	0	1	0
0	1	0	0	1	0
0	0	1	0	1	0

Dot product 3

-1

6 x 6 image

1	-1	-1
-1	1	-1
-1	-1	1

Filter 1

If stride=2

1	0	0	0	0	1
0	1	0	0	1	0
0	0	1	1	0	0
1	0	0	0	1	0
0	1	0	0	1	0
0	0	1	0	1	0

6 x 6 image

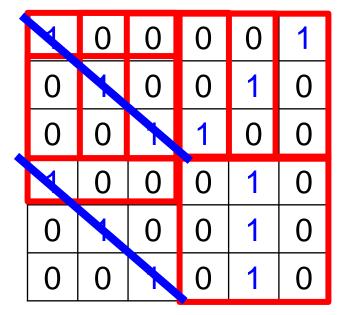

3

-3

-1 -1 -1 -1 1 -1 -1 1

Filter 1

stride=1

6 x 6 image

-3 (-3 (0 1

3 -2 -2 -1

-1 1 -1 -1 1 -1 -1 1 -1

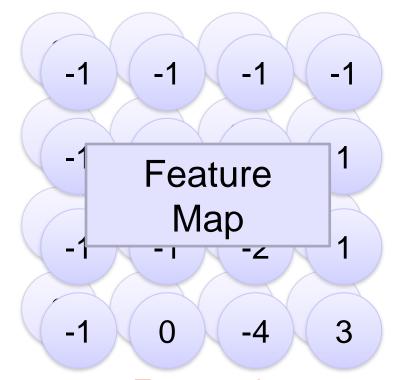

Filter 2

stride=1

1	0	0	0	0	1
0	1	0	0	1	0
0	0	1	1	0	0
1	0	0	0	1	0
0	1	0	0	1	0
0	0	1	0	1	0

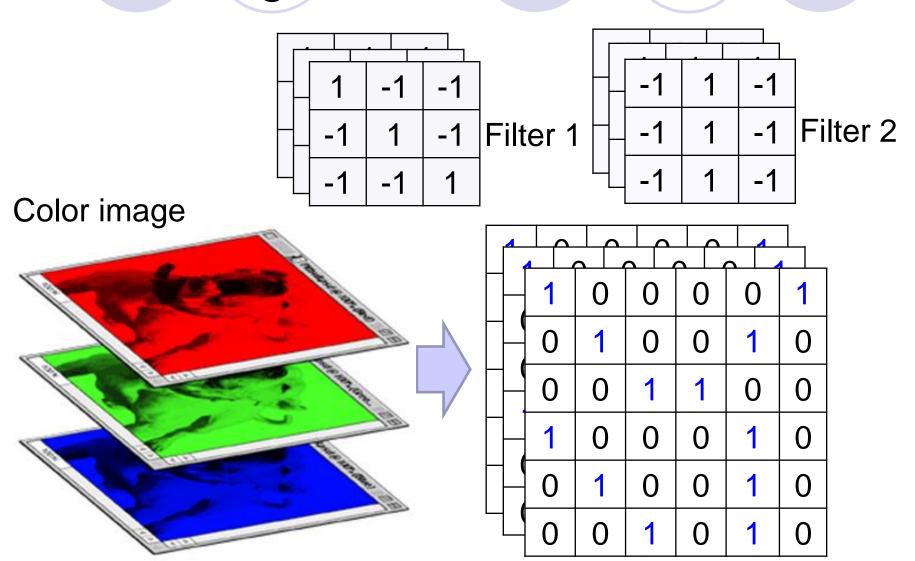

6 x 6 image

Repeat this for each filter

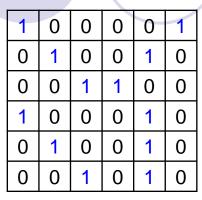

Two 4 x 4 images
Forming 2 x 4 x 4 matrix

Color image: RGB 3 channels

The whole CNN

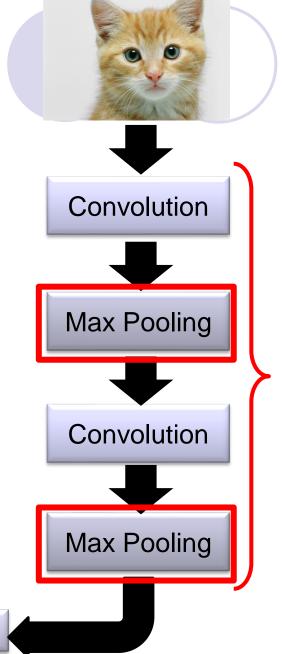

cat dog

Fully Connected Feedforward network

Flattened

Can repeat many times

Max Pooling

1	-1	-1
-1	1	-1
-1	-1	1

Filter 1

Filter 2

3 -1	-3 -1
3 -1	-3 -1
-3 1	0 -3

-3

-3

-1 -1	-1 -1
-1 -1	-2 1
-1 -1	-2 1
-1 0	-4 3

Why Pooling

 Subsampling pixels will not change the object bird

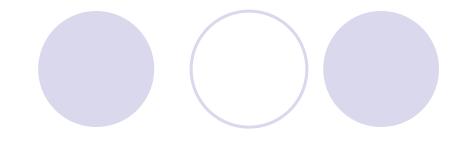

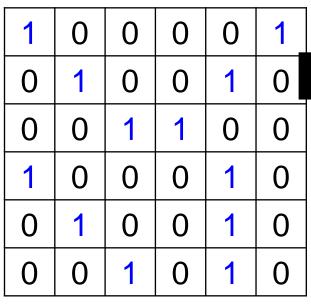

We can subsample the pixels to make image fewer parameters to characterize the image

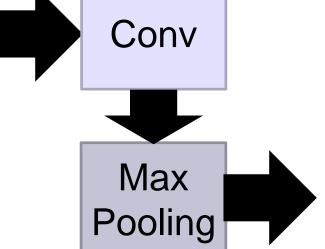

A CNN compresses a fully connected network in two ways:

- Reducing number of connections
- Shared weights on the edges
- Max pooling further reduces the complexity

Max Pooling

6 x 6 image

New image but smaller

-1 1

0 3

2 x 2 image

Each filter is a channel

The whole CNN

-1 1

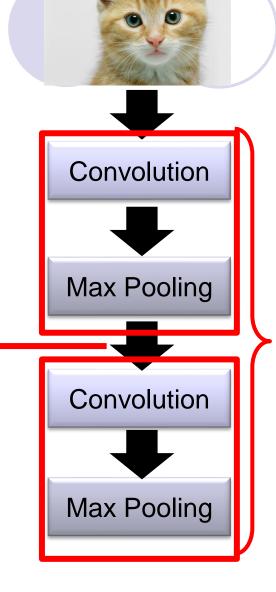

3

A new image

0

Smaller than the original image

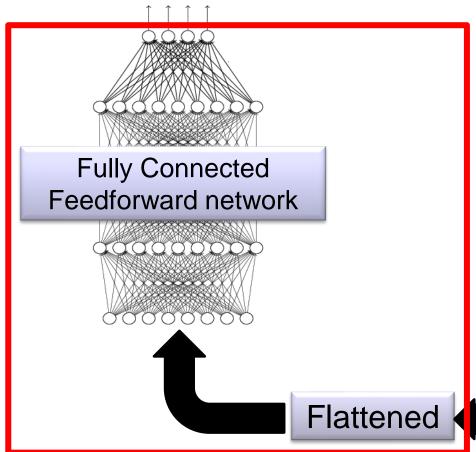

The number of channels is the number of filters

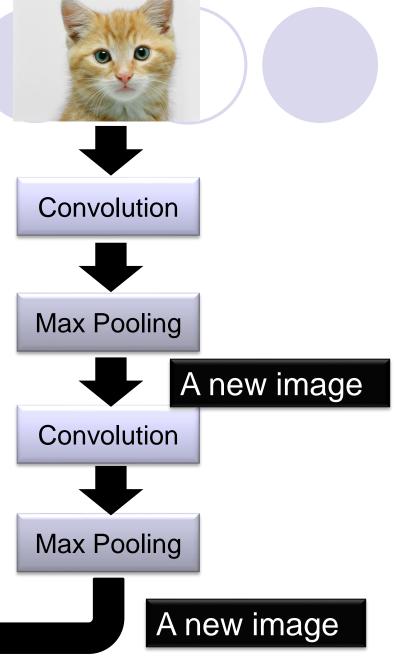

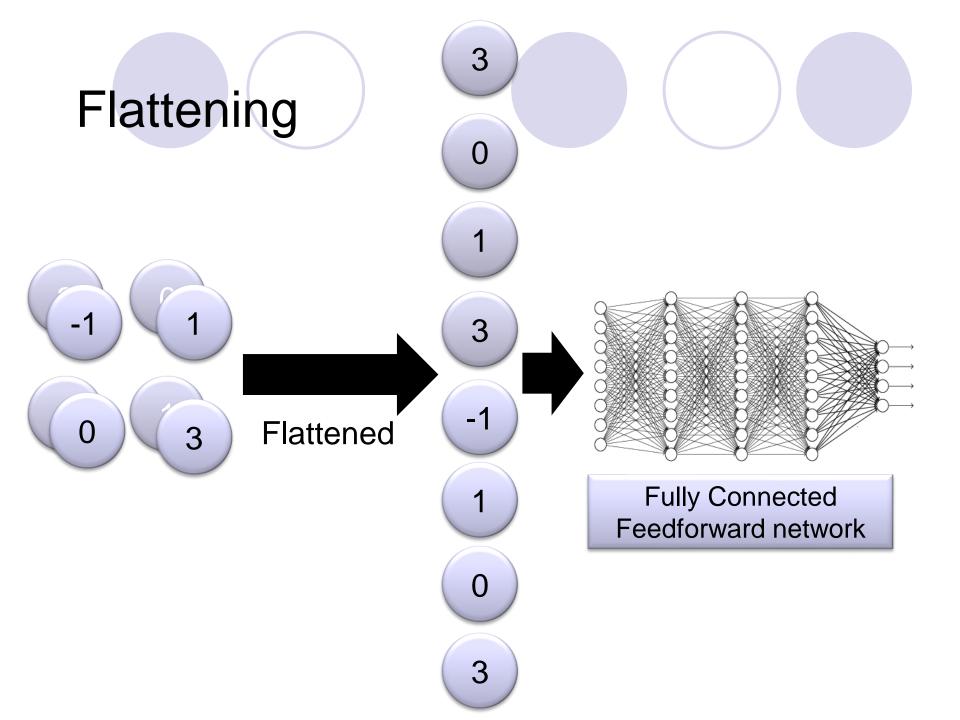

Can repeat many times

The whole CNN

cat dog

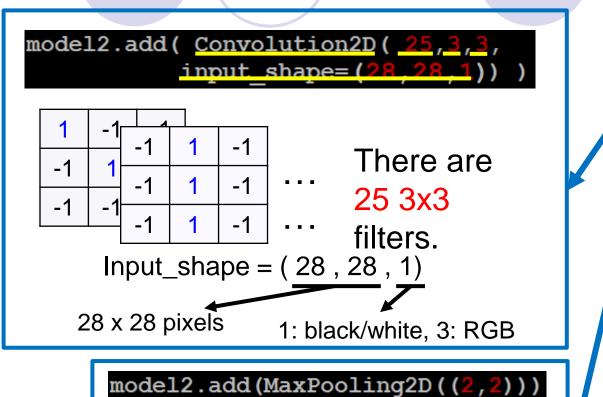

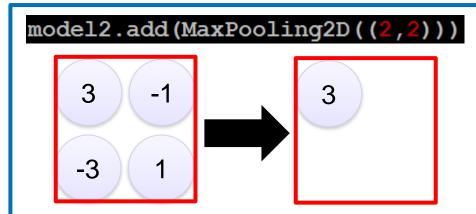

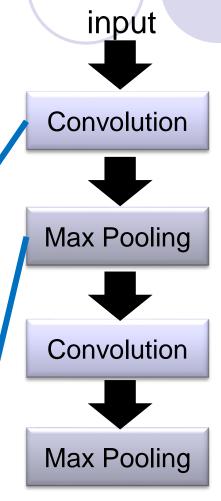

CNN in Keras

AlphaGo

Neural Network •

Next move (19 x 19 positions)

19 x 19 matrix

Black: 1

white: -1

none: 0

Fully-connected feedforward network can be used

But CNN performs much better

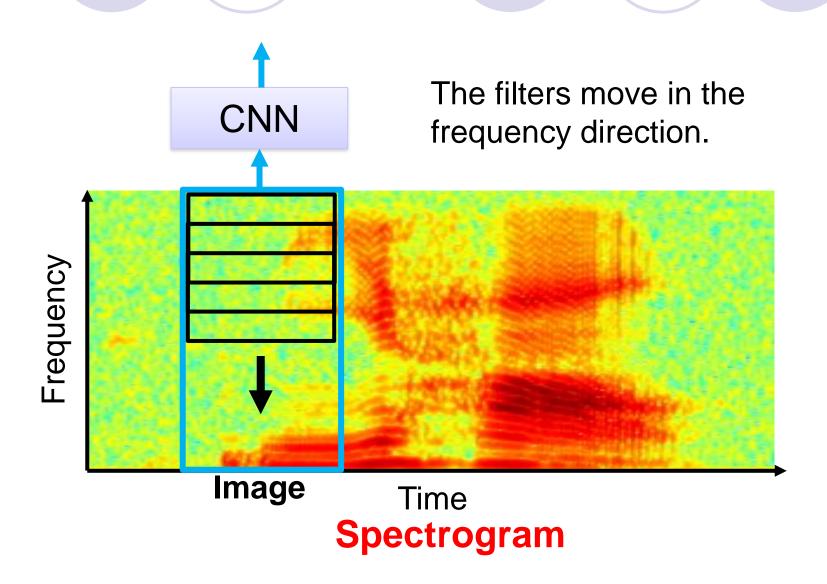

AlphaGo's policy network

The following is quotation from their Nature article:

Note: AlphaGo does not use Max Pooling.

Neural network architecture. The input to the policy network is a $19 \times 19 \times 48$ image stack consisting of 48 feature planes. The first hidden layer zero pads the input into a 23 \times 23 image, then convolves k filters of kernel size 5×5 with stride 1 with the input image and applies a rectifier nonlinearity. Each of the subsequent hidden layers 2 to 12 zero pads the respective previous hidden layer into a 21×21 image, then convolves k filters of kernel size 3×3 with stride 1, again followed by a rectifier nonlinearity. The final layer convolves 1 filter of kernel size 1×1 with stride 1, with a different bias for each position, and applies a softmax function. The match version of AlphaGo used k = 192 filters; Fig. 2b and Extended Data Table 3 additionally show the results of training with k = 128, 256 and 384 filters.
